EDUCATION

San Pablo Colleges · Magna Cum Laude
Bachelor of Science in Computer Science

Hermanos Belen Street, San Pablo City
September 2022 - June 2025

WORK EXPERIENCE

- Senior Associate Solutions ArchitectPDAX Inc, January 2026 - June 2026
- Hardened CI/CD pipelines against software supply chain attacks and standardized automated security and quality checks with Trivy dependency scanning, SonarQube, linting, and pre-commit hooks across GitHub Actions (CI) and AWS (CD).
 - Reduced Mean Time to Remediation (MTTR) by architecting and engineering a serverless, event-driven security ecosystem using Hexagonal Architecture with multiple entry points (CLI and AWS EventBridge); utilized a fan-out pattern with Lambda and SQS to automate the ingestion, routing and idempotency (DynamoDB) of thousands of monthly findings via Jira..
- Senior Associate Software Quality EngineerPDAX Inc, March 2025 - December 2025
- Architected the organization’s foundational QE platform by integrating Docker, Nginx, Jenkins, Vault, Grafana, Grafana Loki, and InfluxDB to centralize test execution and observability; reduced environment setup time by 70% and unified reporting across 6+ cross-functional squads.
 - Designed and built a secure, standardized automation ecosystem for backend and mobile (Robot Framework, Appium, BrowserStack) within a complex monorepo; utilized Hashicorp Vault to automate 100% of secret injection, eliminating manual credential exposure across all pipelines.
 - Engineered an on-demand, high-concurrency performance stack using Grafana K6 to identify critical system bottlenecks by simulating thousands of concurrent users, significantly increasing system reliability and stability during peak traffic periods.
- Software Quality Engineer InternPDAX Inc, February - March 2025
- Developed a hybrid CI/CD pipeline PoC using Jenkins, Docker, and SonarQube to automate smoke tests on PRs and full regression suites for Staging/Production deployments.
 - Engineered and architected a multi-tier CI gate system for test repositories, enforcing QA-led test selection and approval workflows for feature, develop, and master branches.
 - Built a monorepo PoC using Python (UV) and Robot Framework Requests; integrated HashiCorp Vault for centralized secrets and modular coding abstractions.
- Full Stack & Machine Learning EngineerFreelance, September - December 2024
- Developed an end-to-end Legal Document Evaluation System using React, Flask-RESTX, and Docker, automating the assessment of project proposals with a custom NLP pipeline.
 - Engineered a retrieval pipeline utilizing GloVe embeddings for tokenization and SBERT (Sentence-BERT) for deep semantic similarity to match complex legal clauses with project requirements.
 - Deployed a secure, containerized infrastructure using Docker and Cloudflare Tunnels, enabling encrypted, firewall-friendly remote access for the evaluation system.
 - Conducted Exploratory Data Analysis (EDA) using Jupyter, Pandas, and Seaborn to refine the NLP model, reducing false-positive document classifications by 40% during the prototyping phase.

INTERESTS AND TECHNOLOGIES

Interests: Data Science, Full Stack Engineering, Quality Engineering, Architecture, Design Patterns
Languages: TypeScript, Go, Python, PHP, Bash, SQL, Dart
Cloud & Infrastructure: AWS Ecosystem, Docker, Jenkins, HashiCorp Vault, N8N, Grafana, Loki, Git
Systems & Tools: Linux, Arch, Hyprland, Tmux, Neovim

PROMINENT PROJECTS

Itala Personal Finance Platform	2026
- Designed and built an end-to-end personal finance platform from the ground up, spanning a React 19 and TypeScript PWA frontend, a Go REST API on AWS Lambda behind API Gateway, event-driven Go workers for Cognito sign-up flows, and AWS CDK infrastructure-as-code across staging and production. - Implemented hexagonal architecture across every service, with framework-free domain entities and use cases, decorator-based logging and error handling, and single-table DynamoDB storage with GSIs for transaction queries. - Delivered secure authentication via Amazon Cognito JWT validation, idempotent transaction writes, and automatic token refresh, with cursor-based pagination through TanStack Query. Automated delivery with GitHub Actions pipelines using OIDC-based AWS authentication, semantic-release versioning, and staged promotion from staging to production.	
Agentic K6 Performance Test Report Generation	2025
- Built an agentic, multi-agent performance reporting system that automates analysis of K6 load tests and generates comprehensive, actionable PDF reports. Integrated the system into QA pipelines as a containerized Docker action, enabling performance bottlenecks to be surfaced immediately through standardized, objective insights. Designed a processing pipeline that ingests raw K6 CSV output, cleans and aggregates performance data, and transforms it into a structured knowledge base. - Developed three specialized agents: a Performance Analyzer for anomaly detection and threshold violations, a Visualization Planner for standardized color-coded charts, and a Report Builder for combining findings with visualizations. - Developed for PDAX as an internal engineering solution.	
Analyze: An AI and NLP-Enhanced Platform for Sentiment and Insight Extraction	2024
- Designed and implemented a supervised machine learning model using Pandas, NumPy, Scikit-Learn, and Jupyter Notebook with a Multinomial Naive Bayes classifier. The model predicts the sentiment and emotion of sentences using an emotion dataset from Kaggle. - Developed an API for the model using Flask, Flask-RESTX, Gunicorn, Docker, and documented it using OpenAPI/Swagger. - Built the core backend API using PHP Laravel and OpenAPI/Swagger for robust data handling and scalability. - Developed a web client using TypeScript, React, TanStack Router, TanStack Query, TailwindCSS, and ShadcnUI for a dynamic, responsive user interface. - Designed the platform to enable executives to post questions and allow their subjects to respond. The platform predicts the sentiment and emotion of the responses, extracts key concepts, and generates keywords and keyphrases. - Incorporated a summarization feature using a Large Language Model (LLM) from OpenAI to generate summaries of the entire thread.	
Philippine Poverty Area Estimates Choropleth	2023
- Developed a web application providing a visual representation of the estimated magnitude of poor families in the Philippines using a choropleth map. - The map visualizes data from the years 2006, 2009, 2012, and 2015 to give users insights into the poverty distribution across regions. Data source: United Nations Office for the Coordination of Humanitarian Affairs (UN OHCA) and Philippine Statistics Authority (PSA). - The project was built using Python, Jupyter Notebook, NumPy, Pandas, and Streamlit.
